

ABSTRACT OF THE DISCLOSURE

In order to use so-called gray water for the flushing of toilets,
for example in a conveyance such as a passenger aircraft, the
gray water is passed through at least one filter, preferably
5 through a coarse filter followed by a fine filter, into a
treatment tank where it is anodically oxidized. The rinsing is
performed by a pump that may be a rotary pressure pump or a
piston cylinder pump. The pump passes the processed or oxidized
water through an excess pressure valve and through at least one
10 spray nozzle into a toilet bowl.
